

ABSTRACT OF THE DISCLOSURE

A transmission management device of a server utilizing a serial port RS232 and a bus to manage the server and to transmit data. The transmission management device includes a transmission system, a control system and an I/O (Input/Output) system. The transmission system is used for connecting independent sub-systems in the server and transmitting data. The control system is used for receiving data from an external system and interrupt signals from the Interrupting Processing Unit and for communicating with the transmission system directly. The I/O system outputs and inputs the data from the external system into the bus between the transmission system and the control system, achieving the objective of transmitting data and managing the sub-system through the server.
